

## Sample Score 5/6 for Wifi

If a person took a peek around a room, it's probable that he or she would identify some sort of technology; whether it's a computer, smartphone, or T.V. This wouldn't be the case, however, if it wasn't for the beautiful Hollywood star, Hedy Lamar. She invented frequency hopping, also known as WiFi, which is now required in all devices. WiFi enables us to benefit from the internet and smart-phones, plus it helped the Allies win WWII.

Without WiFi, humans would truly be living in the 1800's, since there would be slow communication and no internet. Communication would take forever because it would need to be sent by word of mouth, through the mail, or by telegraph. Without sustainable communication, life would be totally different; nobody would realize what's happening in the world until the event aged a week! Also, there would be no internet without WiFi, which would make us miss out in all it had to offer. The user can buy products online; he or she doesn't need to go to the store to shop, which is convenient. Furthermore, the person may receive news updates in order to keep in touch with the world. Finally, people can learn various things since there are trillions of pages of information.

In this day and age, the majority of people own a smart-phone, whether it's a Samsung, iPhone, or Android. The smart-phone goes above and beyond the average phone. Firstly, if a person wanted to take a photo five years ago, he or she would need to lug around a heavy camera. Also, the user would need develop the pictures, which takes a long time. A smart-phone beats using a camcorder since it offers a camera in the phone, which saves time and money considering it doesn't require picture development. Secondly, before WiFi, in order to receive a call, the recipient needed to be at home. With smartphones, calling can be achieved mobile, since there's no need to be at home to talk to someone. Furthermore, before the smart-phone, email senders were forced to wait long periods of time before getting a response. After it was invented, a person could text, which eliminated waiting for an email response. Additionally, when I'm sitting in a car for long periods of time, it tends to be boring. With smart-phones, the user can play games, which allows him or her to pass the time and feel entertained while playing. All this wouldn't be possible without the use of WiFi, since without it, the phone wouldn't function.

In WWII, the Navy used frequency hopping to ensure their communications weren't intercepted. Without it, the Navy's information could've leaked, which would've led to a defeat on D-Day. As a result, the allies would've lost, and changed history forever. Imagine this: It's 2014, in Nazi America, where Hitler Jr. is our dictator. Every morning, instead of listening to the National Anthem, it's required to listen to the Nazi Pledge. In replace of the Pledge Of Allegiance, it's demanded to cock our arms at a 45 degree angle and shout "Heil Hitler!". There're no freedoms, and if there's a slip up, the person is sentenced to a brutal and bloody death. Does this seem a pleasant environment for a person to live in? It could be that way right now without WiFi.

WiFi changed the world by allowing us to access the internet, work with smartphones, and win WWII. Without WiFi, communication would be slow and there would be no internet. Also, without it, people wouldn't be able to benefit from smart-phones generating easier lives. Finally, without WiFi, the Allies might not have won WWII, due to breached information. WiFi has changed the lives of all people living on this earth forever.
