

The Moon Phases

By Charlotte Filak

In Miss. Gumtow class we did a project where we had to make the moon phases. First is the new moon you can not see the moon at all, next comes the crescent moon you can only see a little piece of the moon, then the first quarter moon the moon is only a quarter of the way, after that is the gibbous moon you can see half the moon, then comes the full moon you can see the whole moon, next the gibbous moon again this time it is waning meaning the part you can see is getting smaller, after that is the last quarter moon it is three quarters the way, last is the crescent moon you can barely see the lighted half. Soon the cycle will start all over again.

For this activity you will need 4 Oreos peel the top of , a knife to spread the Oreo cream, last cut the Oreo cream into what the phases look like.
