

# DR. SELENE

By: Gavin Garcia

## Basics

- 34 protons
- 45 neutrons
- 34 electrons
- Atomic Mass: 78.96

## Characteristics

- I have two forms as an element.
- One is a amorphous red powder
- Another has a bluish, metallic appearance

## History

Jons Berzelius and J. G. Gahn discovered me, first thinking I was tellurium. Since tellurium is rare, they took me to a lab for testing. They discovered me (aka Selenium) although I am alike tellurium.

## Uses

- I am critical for medicine and nutrition in small amounts.
- I am used in the process of photocopying .
- I am used as a coloring agent.

## I'm so good, I'm bad too!

I have two sides. Although I am a doctor in nutrition, I love making mischief. I own a photocopying company, and I am at work when a solar panel is transferring light into electricity. If you have oily hair, use my shampoo line to help it. Lastly, I can toughen up rubber. I love making mischief in several ways too. I play around, staining windows red. I disguise as tellurium to blame it. When I combine other elements, I can cause real mischief! These elements are hydrogen, fluorine, chlorine, and bromine. Once, too much selenium got into a lake, so birds there were being born with genetic deformities. Guess what? That was me taking a vacation there, but I got away just before the police got me. Nitro and Mr. Sulfur are my enemies. They are acids that make me mad so I react. I have two sides, so don't mess with me!
