

## Incredible Moon by Shubham Gupta

I learned that the moon has craters and that the moon is one-fourth the size of earth. I also learned that the moon has 8 phases. I also learned that the moon has less mass and if go to the moon you would weigh six times less than you would on Earth. I also learned that the moon revolution around Earth takes 28 days and that is dusty and is very hot the your blood would boil. I also learned that the moon's craters might have been madero rimed by big chunks of rock and metal.

So this is how my project was so first we got oreos and then our teacher said we are doing a science project. Next I made the new moon and waxing crescent moon. Then I made my first quarter moon and the waxing gibbous. Finally I made my full moon and my waning gibbous and my last quarter and my waning crescent. Now this is the best part you could eat them and if it is science and edible it is edible science.
